1. GridOS SCADA Logging Introduction

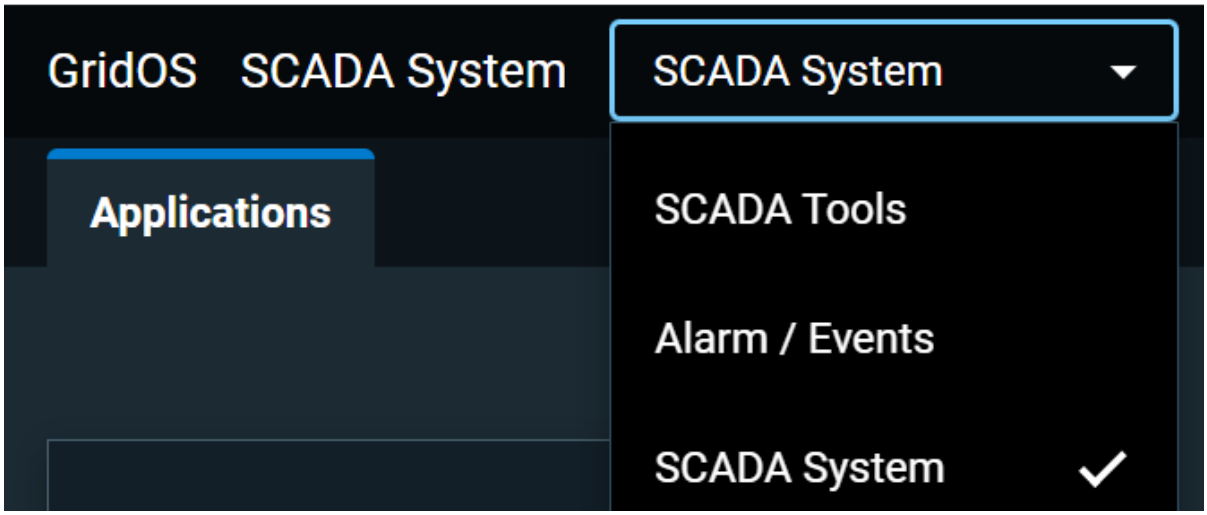
This page contains logging information and the logging UI pertinent only to the SCADA Services applications.

1.1. SCADA Logging UI

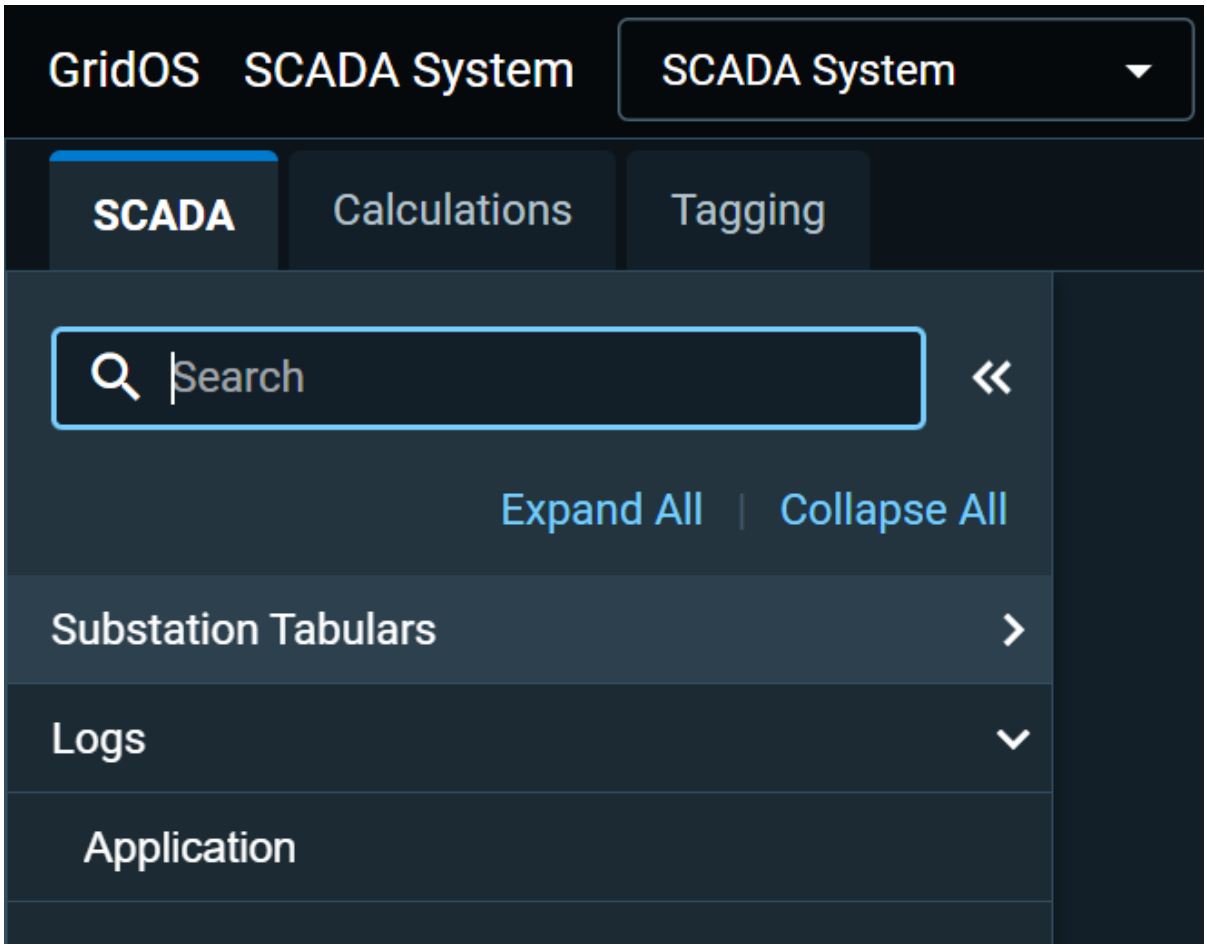
To access the log displays:

1. Open the scada display and navigate to log displays as follows to view logs.

   You can select a display under **SCADA System**, or select **Alarm/Events** from the dropdown at the top of the page to view alarm and event logs within the SCADA application.



2. In the left navigation pane, expand the **Logs** tab.



3. Select the type of logs you want to view.

   The main page displays the available log details.

> **Note**
>
> The Application Log display will only query and populate log messages that have been tagged with the "Scada" message type (msgType).

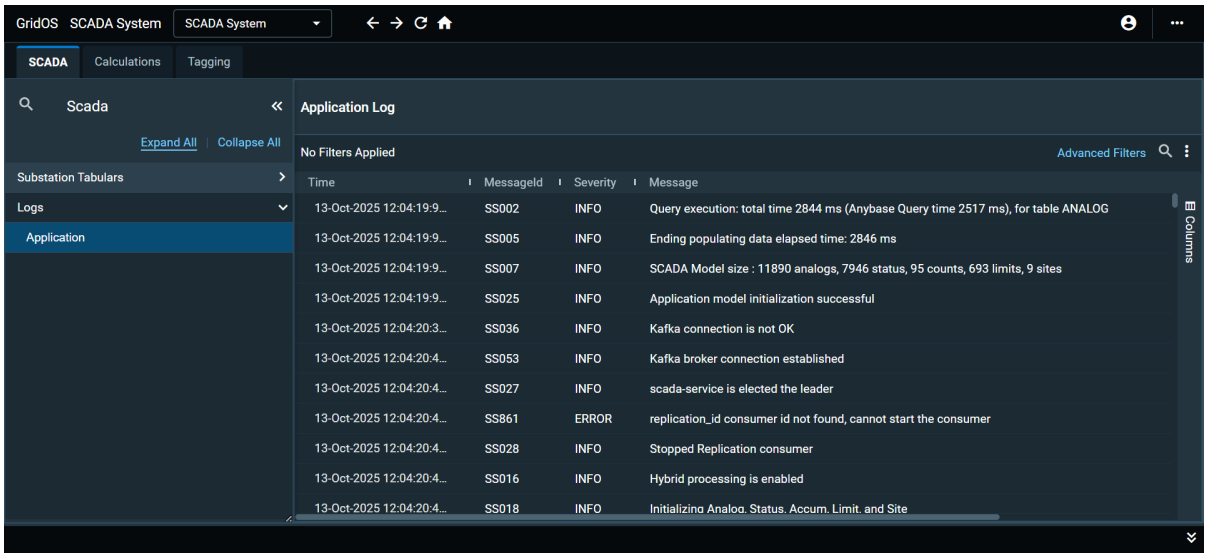


Figure 1. Application Logs UI

4. You can filter and sort the logs based on various criteria.

1.2. UI Technical Details and Manual Log Filtering

All logs and logging levels produced by the SCADA applications are eventually aggregated to ElasticSearch using the Foundation Logging Stack.

The logs can also be manually queried using the Kibana application that is part of the Foundation Base. To access the Kibana application, navigate to `https://<hostname>/monitoring/kibana`, where hostname is either `ingress.local` or your cluster hostname. Kibana views logs stored in ElasticSearch using indexes, and the log results can be filtered by the fields in the Available Fields section under the log index.

More detailed information can be found in the GridOS Foundation user documentation in the Logging section of the *Tutorials* guide.
